Project at a Glance

Project	Community Service Project on Water Pollution
Student	Bitra Manikanta (24JNA30017), III Year B.Tech, AI & Data Science
Faculty guide	Mr. T. Sunil Kumar
Community	Narukuru, Nellore (field visits: Guruthota, Ranganayakulapet and Thotapalligudur)
Output	Field photographs, weekly reports, recommendations and the Jalora awareness website

CHAPTER 1: INTRODUCTION

Water pollution occurs when physical, chemical or biological substances enter rivers, lakes, ponds, canals, tanks, groundwater or coastal waters and change their natural quality. Pollution may make water unsafe for drinking and household use, harm aquatic organisms, create unpleasant odours, block drainage channels and increase the cost of water treatment. Some pollution is easily visible, such as plastic waste along a bank, while other forms—such as dissolved chemicals and disease-causing microorganisms—cannot be identified by sight alone.

Clean water is a shared community resource. Its protection requires responsible household practices, reliable waste collection, effective drainage and sewage systems, suitable agricultural practices, monitoring and cooperation between residents and local bodies. A Community Service Project can help connect scientific understanding with local observations and practical public action.

Need for the Study

During the field visits, the team observed waste scattered along parts of the waterbody edge and rubbish collected in places where runoff can carry it into the water. Such observations indicate a need for improved waste handling and community awareness. They do not, by themselves, prove the presence or concentration of any particular pollutant. The project therefore combines visual observation with educational research and recommends formal testing where water quality must be confirmed.

Importance of the Study

- Protecting water helps reduce risks associated with water-borne disease and unsafe household use.
- Preventing plastics and solid waste from entering waterbodies protects aquatic life and reduces blocked drains.
- Healthy water resources support biodiversity, agriculture, recreation and the well-being of future generations.
- Community participation can make prevention practical, affordable and locally relevant.

Objectives of the Project

- To understand the types, causes and effects of water pollution in the local community.
- To record visible pollution indicators (litter, drainage outlets, floating waste) safely and factually.
- To suggest practical, low-cost prevention measures for households, shops, schools and local bodies.
- To spread awareness through simple messages and an online project page (Jalora website).

CHAPTER 2: OVERVIEW OF THE COMMUNITY AND STUDY AREA

The project focused on community locations in Guruthota and Ranganayakulapet, Nellore, Andhra Pradesh, where the team visited local offices and observed waterbody edges and nearby public areas. The photographs document the setting, the group's interaction with the Panchayat representative and visible waste around selected water edges. The purpose was to understand the local situation and identify possible prevention measures rather than to conduct a certified environmental audit.

Features relevant to water pollution

- Waterbody edges may receive litter carried by wind, rainfall and surface runoff.
- Household wastewater and drainage can affect nearby water if they are not properly collected or treated.
- Open dumping near a waterbody increases the chance that plastics, packaging and mixed waste will enter the water.
- Local authorities, households, shopkeepers, schools and community groups can coordinate practical prevention actions.

Figure 1. Water-access area documented during a community visit.

Study Area at a Glance

Locations observed	Guruthota, Ranganayakulapet, Thotapalligudur and a water-access area in Nellore
Field visit dates	16/10/2026 (waste points, drainage outlet, Panchayat office) and 30/10/2026 (water-access area)
Type of study	Visual observation and photo documentation; no laboratory testing
Main concerns noted	Litter near water edges, waste at a drainage outlet, floating debris and aquatic weed growth

CHAPTER 3: TYPES AND CAUSES OF WATER POLLUTION

Water pollution can be classified by the nature of the pollutant and by the activity that introduces it into the environment. Different sources may act together, especially during rainfall when surface runoff carries waste from roads, open ground and residential areas into drains and waterbodies.

Type	Common sources	Possible concern
Physical pollution	Plastic wrappers, bags, construction debris, suspended soil	Turbidity, litter, blocked flow and habitat damage
Biological pollution	Untreated sewage, animal waste, contaminated runoff	Disease-causing microorganisms and oxygen depletion
Chemical pollution	Detergents, oils, solvents, pesticides, fertilisers	Toxicity, nutrient imbalance and risks to aquatic life
Nutrient pollution	Fertiliser runoff, sewage and food waste	Excessive algal growth and reduced dissolved oxygen
Thermal pollution	Hot-water discharge from certain processes	Changes in water temperature and aquatic habitat
Groundwater pollution	Leaking septic systems, chemicals, poorly managed waste	Contamination that may be difficult to detect or remove

Major Causes

- Improper solid-waste disposal: litter left on open land can be carried into drains and waterbodies by rain or wind.
- Untreated domestic wastewater: sewage and greywater can introduce organic matter, detergents and microorganisms.
- Agricultural runoff: fertilisers, pesticides and soil may be washed into surface water during rainfall.
- Commercial and industrial discharge: poorly treated effluent can introduce chemicals, oils or metals.
- Poor sanitation and animal waste: unmanaged waste can contaminate nearby surface water and groundwater.
- Soil erosion and construction: exposed soil increases sediment in water and can cover aquatic habitats.

Preventing Pollution at the Source

- **Segregate waste** at home into wet, dry and recyclable fractions.
- **Never dump** plastics, oils or chemicals into drains, canals or tanks.
- **Reduce single-use plastic** by using cloth bags and reusable bottles.
- **Maintain drains** so that waste does not block flow and collect at the edge.

CHAPTER 4: EFFECTS AND CONSEQUENCES

Water pollution affects people and ecosystems in interconnected ways. The severity depends on the pollutant, its concentration, duration of exposure, local conditions and the sensitivity of the organisms or people affected.

Area affected	Potential consequences	Why it matters
Human health	Exposure to pathogens or harmful chemicals may cause illness or long-term harm	Safe drinking water, sanitation and testing are essential
Aquatic life	Toxic substances, litter and low oxygen can injure or kill organisms	Biodiversity and ecosystem balance may decline
Water usability	Bad odour, colour, floating waste and contamination can limit uses	Treatment costs and community inconvenience may rise
Local economy	Fishing, farming, recreation and daily work may be affected	Pollution can impose financial burdens on households
Drainage and flooding	Solid waste can block drains and culverts	Heavy rain may cause stagnant water and local flooding
Future generations	Persistent plastics and some chemicals remain in the environment	Prevention is usually easier than later clean-up

Environmental Consequences

Excess nutrients can cause rapid growth of algae and aquatic plants. When this material decomposes, oxygen in the water may fall, stressing fish and other organisms. Plastics can entangle animals or break into smaller pieces. Sediment can make water cloudy and cover habitats. Some chemical pollutants persist in the environment and may accumulate through food chains. These impacts underline the importance of stopping pollution at its source.

Social Consequences

When a local waterbody becomes dirty, residents may lose a useful shared space, face unpleasant smells and become concerned about health and sanitation. People with fewer resources may have less ability to obtain alternative water supplies. Community-led prevention, timely municipal services and clear information can reduce these unequal burdens.

Summary of Impacts

- Polluted water can affect health, aquatic life, daily water use and the local economy.
- Solid waste blocks drains and can lead to stagnant water and local flooding.
- Plastics and some chemicals remain in the environment for a very long time.
- Prevention is usually cheaper and easier than clean-up after pollution has occurred.

CHAPTER 5: OBSERVATIONS AND FINDINGS

The photographs show sections of a waterbody with visible mixed waste on nearby ground and in places along the water edge. Plastic packaging and other discarded material are visible in the photographed locations. These conditions suggest that solid-waste collection, litter prevention and protection of the bank are useful priorities for community action.

Figure 2. Mixed waste and discarded packaging accumulated close to the water edge.

Summary of Field Observations

Observed condition	Likely pathway or concern	Suggested response
Litter on open ground near water	Rain or wind may carry waste into the waterbody	Provide bins, improve collection and discourage dumping
Plastic and packaging waste	Long persistence in the environment; possible harm to animals	Segregation, recycling and regular clean-up
Waste concentrated at the edge	May indicate repeated dumping or runoff accumulation	Identify entry points and monitor them regularly
Community facilities and water access nearby	Public areas need clear responsibilities and maintenance	Coordinate residents and local body staff
Water appearance varies by location	Appearance alone cannot identify chemical or microbial quality	Arrange authorised water testing if water is used for drinking

Note on Evidence

The photographs record visible conditions on the dates and places shown in their GPS stamps. Water-quality conclusions require authorised laboratory testing.

CHAPTER 6: RESULTS, LIMITATIONS AND RECOMMENDATIONS

The project produced a visual record of selected waterbody surroundings, increased understanding of possible pollution pathways and developed a set of community-level prevention recommendations. The photographs provide context for the observed litter and local setting. They are useful documentation but cannot quantify contamination or establish the safety of the water.

Key Recommendations

- Arrange dependable waste collection and discourage open dumping near water edges.
- Prioritise safe removal of accumulated solid waste through the responsible local service.
- Maintain drainage channels and prevent direct discharge of untreated sewage where feasible.
- Provide awareness messages in Telugu and English at public locations and schools.
- Report suspected contamination and request professional assessment rather than relying on appearance alone.
- Conduct periodic follow-up visits and record whether previously identified litter points improve.
- Coordinate clean-up events with safe handling, transport and final disposal of collected waste.

Limitations

The study was limited by the duration of the project and the locations visited. No laboratory results, pollutant concentrations or systematic household survey are included in the available evidence. Conditions may change with rainfall, maintenance and community activity. Future work could include authorised sampling, structured resident questionnaires, mapping of drainage pathways and repeat observations using the same checklist.

Action Plan: Who Can Do What?

Group	Suggested actions
Households	Segregate waste, avoid dumping near water, use water carefully and keep cleaning chemicals and oils out of drains.
Shops and institutions	Provide covered bins, avoid unnecessary packaging and hand waste only to authorised collectors.
Schools and students	Run awareness talks in Telugu and English, poster activities and periodic clean-up drives with safe handling.
Panchayat / local body	Ensure regular waste collection, clear drains, mark dumping hotspots and arrange water testing where needed.
Community groups	Monitor identified litter points, report concerns with exact locations and repeat visits using the same checklist.

Suggested Follow-up Timeline

Short term	Remove accumulated surface waste safely; install signs and bins at identified points.
Medium term	Improve drain maintenance; start regular awareness programmes.
Long term	Regular monitoring, authorised water-quality testing and community ownership of clean-up.

CHAPTER 7: CONCLUSION

Water pollution is an environmental and community-management issue that affects public health, aquatic ecosystems, sanitation and the long-term reliability of water resources. The field photographs document visible waste near selected waterbody edges in the study area. Such observations make litter prevention, responsible waste collection, public awareness and coordinated local action important priorities.

The project concludes that lasting improvement requires more than occasional cleaning. Households must segregate waste and avoid dumping; shops and institutions must manage waste responsibly; local authorities must provide and maintain collection and sanitation services; and residents must report pollution concerns. Where water is intended for drinking, authorised water-quality testing and appropriate treatment are essential. Community participation, practical infrastructure and regular monitoring together offer a realistic pathway toward cleaner and more sustainable water resources.

Learning Outcomes

- Improved understanding of the types, causes and consequences of water pollution.
- Experience in field observation, photo documentation and community-focused reporting.
- Awareness of the limits of visual inspection and the importance of scientific testing.
- Ability to propose practical prevention actions and assign responsibilities.
- Recognition that sustainable water management depends on long-term cooperation.

Way Forward

Lasting improvement needs household responsibility, reliable collection services and regular follow-up. Repeat visits and authorised testing would turn these visual observations into measurable results.

WEEK 1 REPORT

Community Service Project: Water Pollution | Week: 1 | Period: 14/09/2026 – 20/09/2026

Project orientation and understanding water pollution

The first week focused on understanding the purpose and scope of the Community Service Project on water pollution. The topic was narrowed to visible pollution in local drains and water channels, including floating litter, wastewater discharge, stagnant water and careless disposal of household waste. The work at this stage was preparatory: reviewing the issue, listing what could be observed safely and planning how to record the findings without making unsupported claims about water quality.

ACTIVITIES COMPLETED

• Defined the project objectives and prepared a simple observation checklist.

• Reviewed common pollution sources such as plastic litter, household wastewater and waste entering drains.

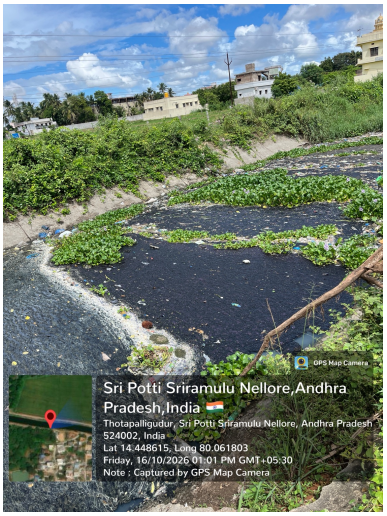

• Planned safe field observation and photo-documentation methods.

LEARNING OUTCOME

The week established that prevention begins with identifying pollution sources and recording observations consistently. Visual inspection can show visible waste or discolouration, but laboratory testing is needed to determine whether water is safe.

PRACTICAL ACTION / NEXT STEP

Use factual descriptions, avoid entering water or unsafe drainage areas, and keep a record of the date, location and visible condition of each observation.

Field evidence used in the project to discuss visible floating waste and surface pollution.

KEY POINTS OF THE WEEK

- Prevention starts with identifying pollution sources and recording observations consistently.
- Each record should note the date, location and visible condition.
- Do not enter water or unsafe drainage areas while observing.

ACTIVITY LOG FOR THE FIRST WEEK

Period: 14/09/2026 – 20/09/2026 Student: BITRA MANIKANTA Register No.: 24JNA30017

DAY & DATE	BRIEF DESCRIPTION OF DAILY ACTIVITY	LEARNING OUTCOME	PERSON IN-CHARGE SIGNATURE
Day 1	Introduced the CSP topic and outlined the purpose of studying water pollution in the local community.	Understood the project scope and the importance of clean water.	
Day 2	Collected background information on common sources of water pollution, including litter and untreated wastewater.	Identified common human activities that can affect water quality.	
Day 3	Prepared a checklist for recording visible pollution indicators during field visits.	Learned to document observations systematically.	
Day 4	Reviewed household waste segregation and safe disposal.	Understood how better waste handling can reduce waste entering drains.	
Day 5	Discussed water conservation and avoiding disposal of oils, chemicals and plastics into drains.	Learned simple preventive practices suitable for households.	
Day 6	Planned the local observation route and information to record during visits.	Prepared for field observation and photo documentation.	

Authorized person in-charge signature: _____

Faculty guide signature: _____ Date: _____

Note: Signature spaces are intentionally left blank for the authorized persons.

WEEK 2 REPORT

Community Service Project: Water Pollution | Week: 2 | Period: 21/09/2026 – 27/09/2026

Local drainage pathways and waste-disposal practices

During the second week, the project examined how litter and household waste can move from streets and open spaces into drains and nearby water channels. The focus was on the relationship between waste disposal, rainwater runoff and blocked drainage. The report distinguishes direct visual observations from general environmental information and does not treat photographs alone as proof of chemical or biological contamination.

ACTIVITIES COMPLETED

• Reviewed the connection between local drains and nearby water bodies.

• Identified visible indicators such as accumulated litter, stagnant flow and discoloured water.

• Prepared simple awareness points on avoiding the disposal of plastics and household waste into drains.

LEARNING OUTCOME

Poor waste handling can allow solid waste to reach waterways, obstruct flow and make public spaces less hygienic. Community awareness and reliable collection services both contribute to prevention.

PRACTICAL ACTION / NEXT STEP

Encourage household waste segregation, keep rubbish out of storm drains and report recurring blockages or dumping with clear location details.

A drainage outlet and accumulated solid waste are visible in this field photograph.

KEY POINTS OF THE WEEK

- Litter on streets and open spaces can reach drains through rain runoff.
- Blocked drains cause stagnant water and make public areas less hygienic.
- Report recurring dumping or blockages with clear location details.

ACTIVITY LOG FOR THE SECOND WEEK

Period: 21/09/2026 – 27/09/2026 Student: BITRA MANIKANTA Register No.: 24JNA30017

DAY & DATE	BRIEF DESCRIPTION OF DAILY ACTIVITY	LEARNING OUTCOME	PERSON IN-CHARGE SIGNATURE
Day 1	Reviewed local water sources and drainage pathways relevant to the study area.	Understood the connection between drainage systems and nearby water bodies.	
Day 2	Observed roadside and community waste-disposal practices from public areas.	Recognized that litter can be carried into drains by rainwater.	
Day 3	Discussed visible signs such as floating waste, discoloured water and stagnant flow.	Learned that visual signs do not replace water testing.	
Day 4	Prepared awareness points about not dumping plastic and household waste into waterways.	Developed clear messages for community awareness.	
Day 5	Reviewed environmental effects of blocked drains and accumulated waste.	Understood the need for timely collection and disposal.	
Day 6	Summarized observations and planned follow-up documentation.	Improved observation and reporting skills.	

Authorized person in-charge signature: _____

Faculty guide signature: _____ Date: _____

Note: Signature spaces are intentionally left blank for the authorized persons.

WEEK 3 REPORT

Community Service Project: Water Pollution | Week: 3 | Period: 28/09/2026 – 04/10/2026

Effects of wastewater and persistent solid waste

The third week focused on the possible effects of untreated domestic wastewater and persistent solid waste entering water channels. Organic waste and wastewater can reduce water quality, while plastic packaging may remain in the environment for a long time and break into smaller fragments. Stagnant or obstructed channels can also affect the appearance and cleanliness of surrounding areas. These are general risks; the project does not claim that a particular health outcome was measured at the photographed location.

ACTIVITIES COMPLETED

• Reviewed how wastewater can carry pollutants into open channels.

• Considered why single-use plastics and mixed waste are difficult to manage once they reach waterways.

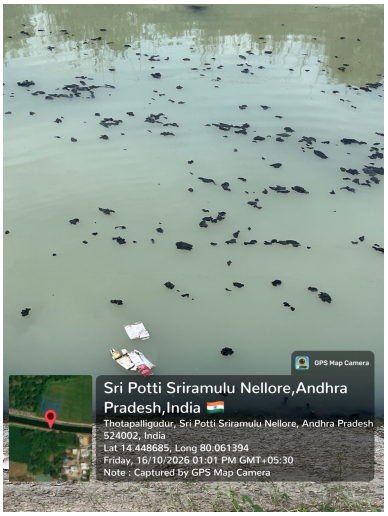

• Prepared guidance on separating recyclable waste from residual waste.

LEARNING OUTCOME

Pollution prevention is more effective when waste is managed before it reaches water. The community can help by reducing disposable plastics and placing waste in suitable collection points.

PRACTICAL ACTION / NEXT STEP

Promote waste segregation, avoid pouring oils or chemicals into drains and support regular removal of accumulated waste.

Floating debris on the water surface, Thotapalligudur (16/10/2026)

Channel with dark floating material and an overflow pipe, Thotapalligudur (16/10/2026)

KEY POINTS OF THE WEEK

- Manage waste before it reaches water: plastics persist and break into fragments.
- Pour no oils or chemicals into drains.
- Support regular removal of accumulated waste.

ACTIVITY LOG FOR THE THIRD WEEK

Period: 28/09/2026 – 04/10/2026 Student: BITRA MANIKANTA Register No.: 24JNA30017

DAY & DATE	BRIEF DESCRIPTION OF DAILY ACTIVITY	LEARNING OUTCOME	PERSON IN-CHARGE SIGNATURE
Day 1	Studied the effects of untreated domestic wastewater entering open channels.	Understood that wastewater can introduce pollutants into the environment.	
Day 2	Reviewed how plastic packaging and other solid waste persist in the environment.	Learned why reducing single-use plastics is important.	
Day 3	Discussed how stagnant, polluted water can affect surrounding cleanliness.	Recognized the importance of maintaining clear drainage routes.	
Day 4	Prepared practical guidance on separating recyclable and non-recyclable waste.	Understood how segregation can improve waste management.	
Day 5	Reviewed water-saving habits and responsible use of household cleaning products.	Learned preventive steps residents can adopt.	
Day 6	Organized observations into themes for the report.	Improved the ability to summarize field information.	

Authorized person in-charge signature: _____

Faculty guide signature: _____ Date: _____

Note: Signature spaces are intentionally left blank for the authorized persons.

WEEK 4 REPORT

Community Service Project: Water Pollution | Week: 4 | Period: 05/10/2026 – 11/10/2026

Community awareness and safe field documentation

The fourth week concentrated on preparing clear community-awareness messages and planning safe field documentation. The work connected the environmental issue with practical actions that residents can take, such as not dumping rubbish into canals, keeping drains clear and reducing unnecessary plastic use. The project also considered the role of local services in waste collection and drainage maintenance.

ACTIVITIES COMPLETED

• Drafted short awareness messages on keeping waterways free from litter.

• Reviewed safe methods for taking photographs from public areas without entering water or drainage channels.

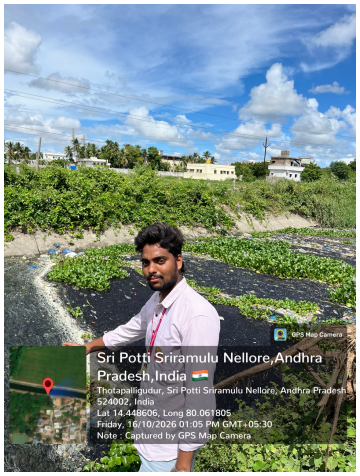

• Listed the information needed when reporting persistent dumping or drainage concerns.

LEARNING OUTCOME

Community participation is important, but residents also need accessible waste collection and timely maintenance. Reports are most useful when they are respectful, specific and based on what can actually be observed.

PRACTICAL ACTION / NEXT STEP

Share practical, non-accusatory messages and provide accurate locations when asking the responsible local office to inspect a concern.

Wider view of the water channel and vegetation, Thotapalligudur (16/10/2026)

Community interaction near the channel, Thotapalligudur (16/10/2026)

KEY POINTS OF THE WEEK

- Awareness messages should be respectful, specific and non-accusatory.
- Residents need accessible waste collection and timely maintenance.
- Photograph from public areas; never step into water or drains.

ACTIVITY LOG FOR THE FOURTH WEEK

Period: 05/10/2026 – 11/10/2026 Student: BITRA MANIKANTA Register No.: 24JNA30017

DAY & DATE	BRIEF DESCRIPTION OF DAILY ACTIVITY	LEARNING OUTCOME	PERSON IN-CHARGE SIGNATURE
Day 1	Planned the next site visit and identified visible indicators to photograph safely.	Learned to document the site without entering unsafe water or drains.	
Day 2	Reviewed the importance of community participation in keeping waterways clean.	Understood that prevention requires cooperation among residents and authorities.	
Day 3	Prepared short awareness messages on avoiding dumping into drains and canals.	Improved communication of pollution-prevention practices.	
Day 4	Discussed possible effects of polluted water on aquatic life and vegetation.	Learned that pollution can affect ecosystems as well as people.	
Day 5	Reviewed how to report persistent waste accumulation or drainage concerns.	Understood the value of accurate location details and factual reporting.	
Day 6	Prepared a checklist for field documentation.	Improved planning for the upcoming visit.	

Authorized person in-charge signature: _____

Faculty guide signature: _____ Date: _____

Note: Signature spaces are intentionally left blank for the authorized persons.

WEEK 5 REPORT

Community Service Project: Water Pollution | Week: 5 | Period: 12/10/2026 – 18/10/2026

Field visit and photographic documentation

The fifth week included field observation and photographic documentation of a local water channel in the Thotapalligudur area of Nellore district. The supplied photographs show surface waste, dark material on the water, aquatic weed growth and a drainage outlet with waste nearby. These photographs record visible conditions only; they do not establish the chemical composition of the water or whether it meets drinking-water standards.

ACTIVITIES COMPLETED

• Visited the water channel and recorded visible surface waste and aquatic vegetation.

• Photographed a drainage outlet and waste accumulation from a safe position.

• Captured both close-up and wider views so that the surrounding context could be understood.

LEARNING OUTCOME

Clear photographs and factual captions help explain the problem and support follow-up. Water-quality conclusions require appropriate testing, while visible waste can be reported for inspection and cleanup.

PRACTICAL ACTION / NEXT STEP

Share documented concerns with the relevant local authority and encourage safe collection of litter without entering contaminated water.

Team at the channel bank, Thotapalligudur (16/10/2026)

Team observing the channel from the bank, Thotapalligudur (16/10/2026)

KEY POINTS OF THE WEEK

- Take both close-up and wider photographs for context.
- Captions should describe visible conditions only.
- Share documented concerns with the relevant local authority.

ACTIVITY LOG FOR THE FIFTH WEEK

Period: 12/10/2026 – 18/10/2026 Student: BITRA MANIKANTA Register No.: 24JNA30017

DAY & DATE	BRIEF DESCRIPTION OF DAILY ACTIVITY	LEARNING OUTCOME	PERSON IN-CHARGE SIGNATURE
Day 1	Visited a local water channel and photographed visible surface waste and aquatic weed growth.	Observed visible pollution concerns and recorded them for the report.	
Day 2	Observed a drainage outlet where wastewater appeared to enter a water channel.	Understood why drainage outlets need proper wastewater management.	
Day 3	Recorded floating waste and debris visible on the water surface.	Learned that solid waste can remain in waterways and affect their appearance and use.	
Day 4	Discussed the observed site conditions and prevention messages.	Connected field observations with practical waste-management actions.	
Day 5	Captured wider photographs of the channel and surroundings.	Learned the value of close-up and wider site views.	
Day 6	Organized photographs and prepared captions describing visible conditions.	Improved evidence-based reporting and documentation.	

Authorized person in-charge signature: _____

Faculty guide signature: _____ Date: _____

Note: Signature spaces are intentionally left blank for the authorized persons.

WEEK 6 REPORT

Community Service Project: Water Pollution | Week: 6 | Period: 19/10/2026 – 30/10/2026

Recommendations, website presentation and final report preparation

The final week brought together the observations, awareness messages and practical recommendations. The Jalora website was presented as a simple online information point for the project, with a project-report area and a water-protection theme. The final report organizes the field evidence, explains the limits of visual observation and recommends everyday actions that can reduce waste entering drains and water channels.

ACTIVITIES COMPLETED

• Organized photographs and prepared captions based only on visible conditions.

• Summarized recommendations on waste segregation, plastic reduction, water conservation and reporting concerns.

• Reviewed the Jalora website presentation and arranged the supporting report documents.

LEARNING OUTCOME

A clear website can help present project information in an accessible format, while sustained improvement depends on responsible household practices and follow-up by relevant services.

PRACTICAL ACTION / NEXT STEP

Continue sharing prevention messages, keep the report and photographs organized, and use the website as a project presentation resource.

NOTE

The Jalora page is a presentation resource. See the Mini-Project Report for its design, features and limitations.

ACTIVITY LOG FOR THE SIXTH WEEK

Period: 19/10/2026 – 30/10/2026 Student: BITRA MANIKANTA Register No.: 24JNA30017

DAY & DATE	BRIEF DESCRIPTION OF DAILY ACTIVITY	LEARNING OUTCOME	PERSON IN-CHARGE SIGNATURE
Day 1	Reviewed field photographs and grouped them by site condition.	Learned to arrange evidence clearly for the final report.	
Day 2	Prepared recommendations on waste segregation, proper disposal and reducing plastic litter.	Identified feasible actions for residents and local services.	
Day 3	Summarized the possible role of local bodies in drain maintenance and waste collection.	Understood the importance of coordinated public services.	
Day 4	Prepared water-conservation and pollution-prevention messages.	Learned to communicate recommendations practically.	
Day 5	Completed the weekly activity record and organized supporting documents.	Improved report preparation and record keeping.	
Day 6	Reviewed the project scope, observations and recommendations for submission.	Consolidated learning from the six-week community service activity.	

Authorized person in-charge signature: _____

Faculty guide signature: _____ Date: _____

Note: Signature spaces are intentionally left blank for the authorized persons.

LETTER OF PERMISSION FROM THE VRO OFFICE

Scanned copy supplied for the Community Service Project; original signatures and office stamp retained.

SREE VENKATESWARA COLLEGE OF ENGINEERING
NBA & NAAC 'A' Grade Accredited Institution
An ISO 9001:2015 Certified Institution
North Rajupalem (Vi), Kodavaluru (M), S.P.S.R. Nellore (Dt.) – 524316

Date: 16/10/26 Place: Narakur

LETTER OF PERMISSION

From:
1. Manikanta (24JNA30017)
2. Vardhan (24JNA30031)
3. Rahul (24JNA30054)
4. Goutham Krishna (24JNA30056)

Sree Venkateswara College of Engineering, North Rajupalem, Nellore District.

To:
The Village Revenue Officer (VRO), Narakur Village,
S.P.S.R. Nellore District, Andhra Pradesh.

Respected Sir/Madam,

Subject: Request for Permission to Conduct a Community Service Project (CSP) on "A Sustainable Action Plan for Preventing and Reducing Water Pollution Through Public Awareness, Waste Management, Water Conservation, and Eco-Friendly Practices for a Cleaner Environment" – Reg.

As per the instructions of APSCHE and JNTUA, second-year B.Tech students are required to undertake a Community Service Project (CSP). We, the undersigned students of Sree Venkateswara College of Engineering, respectfully request your permission to conduct our project in Narakur Village.

Our project aims to develop a sustainable action plan to prevent and reduce water pollution through public awareness, proper waste management, water conservation, and eco-friendly practices. We intend to understand local water pollution concerns, spread awareness among residents, and suggest practical measures to help maintain a cleaner and healthier environment.

We assure you that all project activities will be carried out responsibly and respectfully, without causing inconvenience to villagers. We request your guidance and cooperation and would be grateful if you grant us permission to proceed with this project.

Thank you for your time and consideration.

Yours faithfully,

FOR OFFICE USE
Permission: Granted / Not Granted
VRO Signature: _____
Name: _____
Official Seal: _____
Date: _____

16/10/26.
Panchayat Secretary
Narukuru Gram Panchayat
Thotanalli Gudur Mandal

PERMISSION DETAILS

Date and place	16/10/2026, Narukur village
Addressed to	Village Revenue Officer (VRO), Narukur Village, SPSR Nellore District
Requested by	Four B.Tech students of Sree Venkateswara College of Engineering
Endorsed by	Panchayat Secretary, Narukuru Gram Panchayat, Thotapalli Gudur Mandal (dated 16/10/2026)

FIELD VISIT WITH THE COMMUNITY OFFICE REPRESENTATIVE

Photograph supplied as evidence of the community-office visit associated with the permission and guidance for the project.

Community interaction photograph supplied by the student.

VISIT DETAILS

Place	Thotapalligudur, Sri Potti Sriramulu Nellore, Andhra Pradesh 524002
Date and time	16/10/2026, 12:05 PM (as per GPS stamp)
Co-ordinates	Lat 14.446175, Long 80.060942
Purpose	To meet the Panchayat representative about the project and obtain permission and guidance (see permission letter)

POINTS KEPT IN MIND DURING COMMUNITY INTERACTION

- Be respectful and explain the purpose of the project clearly.
- Ask for permission before photographing public or private areas.
- Record facts only and avoid blaming individuals or groups.
- Note exact locations when reporting a concern to the local office.

FIELD VISIT WITH THE FACULTY GUIDE

Photograph supplied showing the student group with the faculty/community guide during project-related interaction.

Faculty-guide interaction photograph supplied by the student.

VISIT DETAILS

Place	North Rajupalem, Kodavalluru, Sri Potti Sriramulu Nellore, Andhra Pradesh
Date and time	31/10/2026, 02:05 PM (as per GPS stamp)
Co-ordinates	Lat 14.5643, Long 79.9887
Purpose	Interaction with the faculty guide on the completed project work and report

CHECKLIST BEFORE SUBMISSION

- Signatures of the person in-charge and faculty guide on each weekly activity log.
- Endorsements of the Faculty Guide, Head of the Department and Principal.
- Date of submission entered on the report page.
- Self-evaluation form completed by the authorised evaluator.
- Jalora website link and PDF button checked before sharing.

MINI-PROJECT REPORT

JALORA — WATER POLLUTION AWARENESS WEBSITE

Project title: A web-based information and awareness platform for water protection and community action.

ABSTRACT

Jalora is a website created to present the Water Pollution Community Service Project in a clear, accessible format. Its visual theme focuses on protecting water and preserving aquatic life. The landing page introduces the project report and provides a place to view the report PDF. The website is intended to help readers understand the purpose of the project, review the documented field observations and learn practical ways to reduce water pollution. It is a student project presentation, not an official municipal complaint-processing system unless such a feature is separately implemented and tested.

PROBLEM STATEMENT

Water pollution is worsened when plastic litter, household waste and untreated wastewater reach drains and water channels. Community members may not always have a convenient source of concise awareness information or an organized presentation of local observations. The mini-project addresses this communication need by providing a single web page through which the CSP report and project details can be presented.

OBJECTIVES

• Present the CSP topic and its purpose in a simple, readable online format.

• Show the project report through a clear view/download area.

• Support public awareness about waste disposal, plastic reduction and water conservation.

• Organize field photographs and project information for academic presentation.

• Provide a web-based starting point for future educational improvements, subject to testing and responsible maintenance.

MINI-PROJECT AT A GLANCE

Name	Jalora – Water Pollution Awareness Website
Type	Single landing page presenting the CSP report
Hosting	Deployed on Vercel (jalora-phi.vercel.app)
Theme	Underwater, blue-to-teal design to highlight water protection
Developer	Bitra Manikanta
Audience	Students, residents and local-body staff interested in clean water

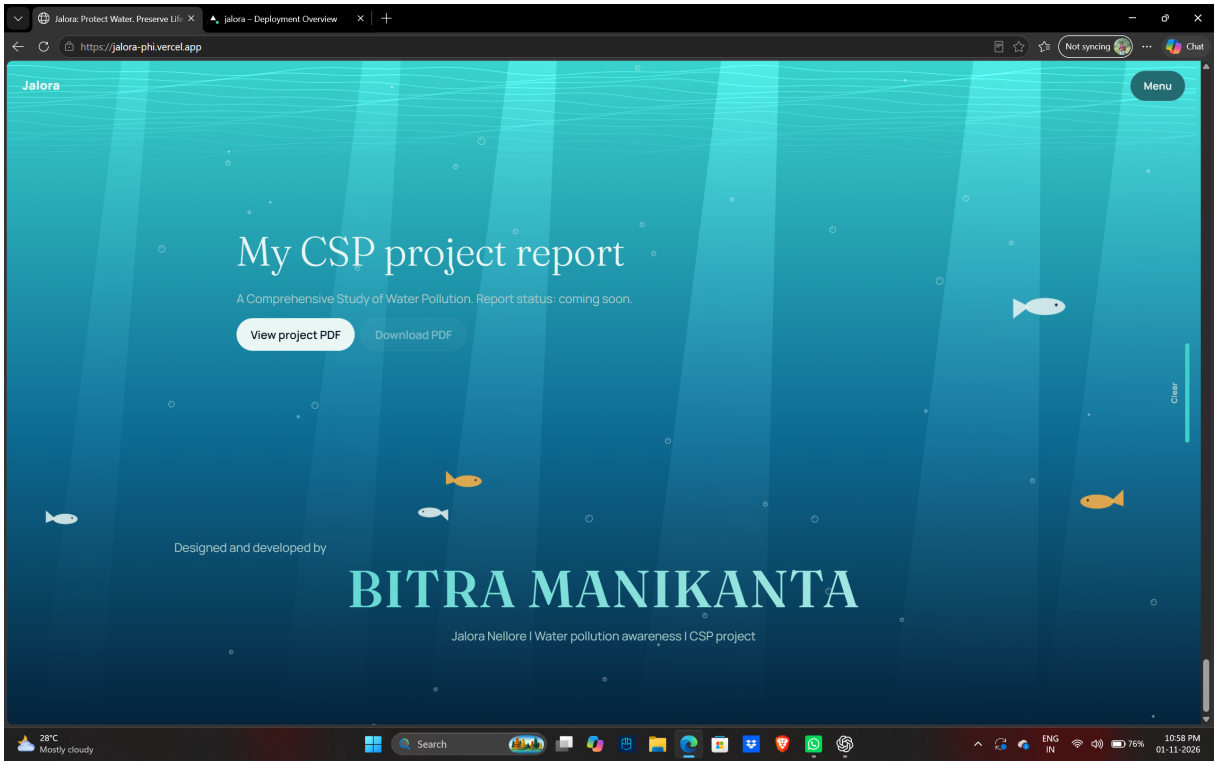

WEBSITE DESIGN AND IMPLEMENTATION

Jalora uses a water-themed interface with a blue-to-teal background, simple navigation and a prominent project-report section. The supplied screenshot shows the landing page with the heading “My CSP project report”, a short description and controls for viewing the project PDF. The page also displays the developer credit supplied for the project.

WEBSITE LINK

https://jalora-phi.vercel.app/

Open the link in a browser to view the deployed website. The availability of the PDF button depends on the report file being correctly connected in the deployment.

Screenshot of the Jalora website supplied by the student.

HOW TO USE THE WEBSITE

1. Open https://jalora-phi.vercel.app/ in any browser on mobile or desktop.
2. Read the project heading and description on the landing page.
3. Tap **View project PDF** to open the report once the PDF file is linked.
4. Use **Download PDF** to save a copy when the control is enabled.
5. Use the Menu button to move to other sections if available.

WEBSITE FEATURES, USE AND FUTURE SCOPE

MAIN FEATURES SHOWN IN THE SUPPLIED SCREENSHOT

Project landing page: Introduces the CSP report and water-protection theme.

View project PDF: Provides a visible route to open the report when the PDF asset is configured correctly.

Download PDF: A dedicated download control is shown; it should be enabled only after the correct PDF file is linked.

Responsive presentation: The design should be checked on mobile and desktop screens to keep text and controls readable.

Developer credit: The landing page displays the project developer credit as supplied.

COMMUNITY BENEFIT

The website can support awareness by making the project report easy to find and by giving students and community readers a clear explanation of visible water-pollution concerns. Practical messages can encourage residents to keep waste out of drains, reduce single-use plastics, conserve water and report persistent dumping through appropriate official channels. The website should not promise that a complaint has been delivered to a municipality unless a real, tested submission mechanism is implemented.

LIMITATIONS AND FUTURE ENHANCEMENTS

The screenshot confirms the website landing page, but it does not by itself verify every backend feature. Future improvements could include a verified official-contact directory, a clearly explained complaint-reporting workflow, accessible language options, stronger form validation, privacy safeguards and routine link checks. Any complaint feature should identify the receiving authority, avoid exposing personal information unnecessarily and clearly state whether a message is submitted or only prepared for the user.

CONCLUSION

Jalora provides a visual online presentation for the Water Pollution CSP and its supporting report. Together with the field photographs and weekly activity records, it helps organize the project materials and communicate practical prevention messages. Continued usefulness depends on keeping the content accurate, the report link functional and any future interactive features properly tested.

CHECKLIST BEFORE SHARING THE WEBSITE

Item	What to confirm
Link	The website opens correctly on mobile and desktop
Report PDF	The final PDF is uploaded and the View button opens it
Download	The Download PDF control works after linking the file
Content	Text states only what is supported by the field evidence
Features	No complaint or contact feature is claimed unless tested

STUDENT SELF-EVALUATION FOR THE COMMUNITY SERVICE PROJECT

Student Name	BITRA MANIKANTA
Registration No.	24JNA30017
Period of CSP	Six-week activity record (September–October 2026)
Date of Evaluation	_____
Name of Person In-charge	_____
Address / Project Location	Narukur / Nellore District, Andhra Pradesh

No.	Evaluation criterion	1	2	3	4	5
1	Written communication	○	○	○	○	○
2	Pro-activeness	○	○	○	○	○
3	Interaction ability with community	○	○	○	○	○
4	Positive attitude	○	○	○	○	○
5	Self-confidence	○	○	○	○	○
6	Ability to learn	○	○	○	○	○
7	Work plan and organization	○	○	○	○	○
8	Professionalism	○	○	○	○	○
9	Creativity	○	○	○	○	○
10	Quality of work done	○	○	○	○	○
11	Time management	○	○	○	○	○
12	Understanding the community	○	○	○	○	○
13	Achievement of desired outcomes	○	○	○	○	○
14	Overall performance	○	○	○	○	○

Date: _____ Signature of the person in-charge: _____

Faculty guide signature: _____ HOD signature: _____

Evaluation ratings and signatures are intentionally left blank for completion by the authorized evaluator.
